PUBLICATIONS - PEER REVIEWED JOURNAL ARTICLES

- Italian Economic Journal* 2020 The Dynamics of Wealth Concentration: Thoughts on Tony Atkinson's Contributions
Following new evidence on increasing wealth concentration across several advanced countries, the topic has been attracting a great deal of attention. Estimating the size distribution of wealth and understanding its determinants is an exercise surrounded with high levels of uncertainty and substantial controversies, but remains crucial to guide policy interventions. This short note attempts to link Tony Atkinson's body of work on wealth concentration to the fast expanding empirical research on wealth measurement as well as on the determinants of its growing concentration.

- Journal of Public Economics* 2018 Top Wealth Share in the UK over more than a century
The paper estimates the long-run evolution of top wealth shares for the United Kingdom from 1895 to the present. We find that the application to the estate data of mortality multipliers to yield estimates of wealth among the living does not substantially change the degree of concentration over much of the period both in the UK and US, allowing inferences to be made for years when this method cannot be applied. The results show that wealth concentration in the UK remained relatively constant during the first wave of globalization, but then decreased dramatically in the period from 1914 to 1979. However, the decline in UK wealth concentration came to an end around 1980, and since then there is evidence of an increase in top shares, notably in the distribution of wealth excluding housing in recent years. We investigate the triangulating evidence provided by data on capital income concentration and on reported super fortunes.

- Journal of Economic Inequality* 2018 Banking Crises in the US: the Response of Top Income Shares in a Historical Perspective
This paper examines the response of income concentration in the US to the occurrence of major systemic banking crises since the beginning of the twentieth century. In doing so, the paper analyzes the shape of the upper income tail as well as the national income shares accruing to different groups within the richest decile. The findings suggest that systemic banking crises reduce income concentration within the top decile of the US pretax and transfers income distribution, and more generally, that the effect is highly heterogeneous across different top income groups. While the richest income group loses ground, the lower half of the top decile appears to gain in relative terms. However, evidence suggests that the estimated short-term effect of market forces stemming from banking crises can be relatively small in magnitude and even temporary in nature, as it may be quickly reabsorbed. These findings lend indirect support to the idea that only substantial changes in government policies and institutional frameworks can bring about radical changes in income distribution.

- Fiscal Studies* 2016 The Challenge of Measuring UK Wealth Inequality in the 2000s
In this paper, we use evidence from existing data sources to attempt to answer three questions: (i) What is the share of total personal wealth that is owned by the top 1 per cent, or the top 0.1 per cent? (ii) Is wealth much more unequally distributed than income? (iii) Is the concentration of wealth at the top increasing over time? The main conclusion of the paper is that the evidence about the UK concentration of wealth post-2000 is seriously incomplete and significant investment in a variety of sources is necessary if we are to provide satisfactory answers to the three questions.

- Economia Politica* 2015 Inequality and Crises Revisited
Recent debate has suggested that growing levels or high levels of inequality may be systematically associated with the occurrence of banking crises. Using the updated version of the Chartbook of Economic Inequality, this paper provides new empirical evidence on the level hypothesis and reassesses the empirical validity of the growth hypothesis. In line with previous work, the empirical analysis on the entire set of countries and years under investigation does not provide any conclusive and compelling statistical support to either of the hypotheses. However, the apparent statistical insignificance of the findings does not rule out the economic relevance of the question at hand, given that the hypotheses cannot be rejected for important crises and countries such as the US and the UK. Hence, the overall evidence is far from being conclusive and there are several reasons to shed further light on this important research topic.
