PUBLICATIONS

Corporate hedging, family firms, and CEO identity

[2022]

EUROPEAN JOURNAL OF FINANCE

We study the propensity to hedge of closely-held family-managed firms. Family involvement in CEO positions positively affects the likelihood of hedging. The effect is stronger when the CEO belongs to the founding family, especially for long-tenured and founder CEOs. This evidence is consistent with the higher conservatism of family agents, aimed at protecting socioemotional wealth and avoiding loss of reputation and control. Information asymmetry and, more mildly, underdiversification increase the propensity to hedge. Corporate governance attributes proxying agency issues are not significant.

Defining the Relationship Between Firm's Performance and Delisting: Empirical Evidence of Going Private in Europe

[2022]

Journal of the Knowledge Economy, 13, 2584–2605

One of the reasons why a firm chooses to go private is the significant amount of cash flows which can exacerbate agency costs: this can indicate poor growth opportunities and make external resources less required. In line with both knowledge economy and financial literature, the paper aims to indagate the relationship between agency costs, firm's performance, and delisting. Despite there is evidence in finance that highlights the role of exchange regulators in the going private processes, just few studies focus on the voluntary delisting and its antecedents. Starting from the knowledge economy setting, this paper aims to define how firm's financial performance moderates the relationship between agency costs and delisting choices. Based on a sample of non-financial firms delisted from the most important European stock markets between 1997 and 2017, we applied an OLS regression to analyze the main variables that influence the going private processes. We find that a high level of stock market performance, associated with high level of free cash flows, promotes going private as a means of anticipating and

preventing future value decreases. Finally, the paper provides practical implications for the development of new approach of delisting choice.

How much is CEO education worth to a firm? Evidence from European firms

[2017]

PSL QUARTERLY REVIEW, 70(282), 311-353

The emergence of an industry dedicated to evaluating the quality of university institutions around the world makes it possible to analyze whether students who graduate from highly-ranked schools perform better during their working lives. We focus on the education of CEOs who lead European listed firms, and analyze its impact on firm performance. If better schools produced better managers, we should find better firm performance for the firms led by managers who have graduated from highly-ranked schools. However, we do not find clear support for this claims, and rather our analysis shows that the ranking position of a university is not significantly linked to firm performance. Moreover, we find that the results of any such estimate are highly sensitive to the performance measure used and the type of ranking chosen. "QS University Rankings" and "Times Higher Education University Rankings" produce results that are more in line with our assumption. Unlike accounting ratios, market-based performance measures tend to provide stronger support for our hypothesis.

21 years of international M&As and joint ventures by Italian medium-sized listed firms: value creation or value destruction?

[2011]

RESEARCH IN INTERNATIONAL BUSINESS AND FINANCE, 25, 1(1), 75-87

This study provides evidence of the value creation of different equity entry modes in a sample of international investments performed by all Italian medium-sized listed firms in the period 1986–2006. Our research shows a positive and significant market reaction to announcements of internationalization strategies. The results are largely affected by high-equity entry modes carried out in advanced economies. Low-equity entry modes and international operations performed in emerging countries show no significant market reaction. We also find that the relative size of the deal, the firm age, the country risk, and the evolution of information disclosure regulation, matter in explaining the outcomes.
